12. Security Do's and Don'ts
13. Troubleshooting & FAQ

1. Welcome & Roles

Feast9 covers the full patient journey for a single-practitioner dental clinic: registration, treatment cases, clinical records, billing, appointments, reports, and India's DPDP Act 2023 data-protection requirements. Every staff member signs in with their own account, and what you can see and do depends on your assigned role.

Role	Can do
Receptionist	Register/search patients, book appointments, add clinical notes, log DPDP requests, use the calendar. No access to payments, costs, balances, reports, analytics, financial exports, or backups — this is enforced by the system, not just hidden from view.
Doctor	Everything a Receptionist can do, plus full financial access (payments, cost revisions, Reports, Analytics, Financial Assessment), dental charting, consent recording, clinical-attachment deletion, and resolving DPDP requests.
Administrator	Everything a Doctor can do, plus user management, Doctors/Case Types setup, Clinic Details, Login Screen branding, backups, and the audit log.

If a screen or button you expect isn't there, it is almost always because your role doesn't include it — this is by design, not a bug.

2. Signing In & Securing Your Account

First-time setup

- The very first person to open Feast9 sees a one-time Setup page and creates the founding Administrator account, including a security question for password recovery.
- Every account after that is created by an Administrator from **Users**.

Logging in

- Enter your username and password on the login page.
- If your account has Two-Factor Authentication (2FA) turned on, you'll be asked for a 6-digit code from your authenticator app (or a one-time recovery code) on a second screen before you're let in.
- Forgotten your password? Use **Forgot Password** on the login page and answer your security question to set a new one — no email required.

Turning on Two-Factor Authentication (recommended for everyone)

- Go to **2FA** in the top navigation bar.
- Scan the QR code with an authenticator app (Google Authenticator, Authy, etc.) or type the key in manually.
- Enter the 6-digit code it shows you to confirm setup.
- You will then see a set of one-time **recovery codes** — write these down and store them somewhere safe. Each one can be used once if you ever lose your phone. They are shown only this one time.

Lost your phone and your recovery codes? Only an Administrator can reset your 2FA from the Users page. Don't share recovery codes with anyone, and never photograph the QR code for someone else's phone.

Signing in with Google (if enabled by your clinic)

- Go to **My Account** and choose **Link Google Account** while already signed in — this is a one-time step that ties your Google identity to your existing Feast9 account.
- Google sign-in can never create a brand-new account and never bypasses your clinic's normal password/2FA setup on its own — it is only an alternate way in for an account you have already linked.

"Please sign in again" prompts

A handful of sensitive actions — creating or deactivating a user, resetting someone's 2FA, deleting a clinical document, running or downloading a backup — ask you to confirm your password again if it has been more than 10 minutes since you last authenticated. This is intentional: it stops someone from misusing a screen you left open and unattended.

3. Patients

Registering a new patient

- Go to **Patients -> New Patient**.
- Name and Sex (Male/Female) are required; enter Date of Birth and the age field fills in automatically.
- Record any medical conditions, allergies, and — for a patient under 18 — a guardian's name, relation, and a valid mobile number (mandatory for minors).
- You must tick the **Data Processing Notice** checkbox after reading it — registration cannot be completed without it. This is a legal requirement under India's DPDP Act and cannot be skipped for any patient.
- Communications consent (for reminder messages) is a separate, optional tick-box, off by default.

Finding a patient

- The search box on the Patients page matches name, mobile number, email, address, and even text inside past visit notes and prescriptions — so you can find a patient by symptom or medicine name too.
- A **Historic Import** badge marks patients that were bulk-loaded from an old spreadsheet rather than registered through the app.

Reading the patient list's colour dots

- **Red dot** — this patient has an overdue follow-up.
- **Amber dot** — a follow-up is due within the next 3 days.
- No dot — nothing needs attention right now.

The patient detail page

Always shown in this order: **Medical Alerts** (allergies/conditions at a glance), **Active Treatment Cases**, **Appointments**, and **Contact Details & DPDP Status** (which also lists any data-rights requests for this patient). A cross-case **Prescription History** is shown further down.

If a patient's record shows an "Erased" banner, an Erasure request has been completed for them — their personal details are anonymised, but their clinical and billing history is preserved exactly as required by law.

4. Treatment Cases

A Case is one course of treatment for a patient (e.g. "Root Canal — upper left molar"). Open one from the patient's page with **New Case**. Every case page always shows the same nine sections, in the same order, so the layout never surprises you:

- **1. Consent Forms** — record that the patient consented to treatment. A red border appears around this section on an Active case until consent is recorded. You can type notes, or capture a hand-drawn signature directly on screen.
- **2. Visit Notes** — a running, permanent log of what happened at each visit. Notes can only be added, never edited or deleted — if something needs correcting, add a new note explaining the correction. This protects the clinical record.
- **3. Prescriptions** — same append-only rule as visit notes. An allergy banner appears automatically if the patient has any recorded allergy.
- **4. Clinical Attachments** — X-rays, photos, and lab reports. Only a Doctor or Administrator can delete a file (with a reason), and a bulk "clear all" option for a case that no longer needs its files requires a reason too. Receptionists cannot delete clinical files, by design.
- **5. Lab Requisitions** — track work sent to an external lab (Sent / Received / Delayed). If the patient has an appointment coming up in the next 3 days and a requisition is still open, it's flagged here so nothing gets missed.
- **6. Referral Notes** — collapsed by default; click to expand. A printable referral letter is available from here.
- **7. Payment Log** — every payment received against this case (financial data — see §1 for who can see this).
- **8. Follow-up & Next Action** — a reminder note and date for the practice, shown on the Dashboard and the patient list. This is *not* the same as an appointment (see §6) — booking an appointment from here automatically clears the reminder.
- **9. Cost History & Revisions** — every time the case's total cost is changed, the old and new amounts are recorded here automatically, with a reason.

A case's balance (total cost minus payments received) is always calculated live — it is never something you edit directly.

Close a case only when treatment is genuinely finished, using the **Mark as Closed** action — this timestamps the closure for reporting and cannot be triggered automatically.

5. Dental Chart

A visual, whole-mouth chart reachable from a patient's page via **Dental Chart**. It uses standard international (FDI) tooth numbering and shows both adult and baby teeth, since many patients have a mix of both.

- Click any tooth in the diagram to add a new finding for it — Sound, Caries, Restoration, Crown, Root Canal, Implant, Missing/Extracted, Fracture, or Other — and mark it as Existing, Planned, or Completed treatment.
- The chart always shows the *current* state per tooth. Every entry you add is kept permanently in the tooth's history underneath — nothing is ever overwritten or deleted. A correction is simply a new entry.
- Marking a tooth Missing/Extracted replaces its display with that single fact, since a missing tooth has no surface left to chart findings on.

6. Appointments & the Calendar

- The Calendar (top navigation) shows a month view colour-coded by doctor.
- Click any day, or **New Appointment**, to book — choose patient, doctor, date, time, and an optional title/notes.
- **Recurring appointments**: choose a recurrence pattern (Weekly / Biweekly / Monthly) and Feast9 creates every occurrence up front (up to 52), marked with a small recurring-series badge on the calendar. When editing one, you choose **this occurrence only** or **the whole series** — a series-wide edit never touches an occurrence that's already Completed, Cancelled, or a No-show, so its history is never rewritten.
- Marking a visit **No-show** automatically creates a follow-up reminder for the next day on that patient's active case, so it doesn't get forgotten.
- The appointment edit page has ready-made reminder text you can click to copy straight into WhatsApp or an SMS.

Booking an appointment from a case's Follow-up section (the "Book Appointment" link) automatically clears that follow-up reminder — you never have to clear it by hand.

7. The Dashboard

Your homepage after login. Four tiles summarise the practice at a glance:

- **Follow-ups Needing Attention** — **overdue** shown before **upcoming**; a green celebration message when there's nothing to chase.
- **Total Outstanding Balance** — hidden from Receptionists (shows "Restricted" instead), since it's financial data.
- **Active Cases** and **Today's Appointments** — with status colour coding matching the calendar.

A fifth section lists any open lab requisitions for patients with a visit coming up in the next 3 days, so a delayed lab job doesn't surprise anyone at chairside.

8. Reports & Analytics

Who can do this: Doctor, Administrator only — Receptionists cannot open these pages.

Reports

- Set a date range and see revenue collected, cases closed, new cases, and new patients for that period, alongside pending balances by patient, doctor-wise revenue, and a patient-retention check.
- Download the pending-payments list as an Excel file, or print the whole report as a PDF.

Analytics

A separate tab with a year selector and 8 charts — monthly revenue, new patients, case and appointment status breakdowns, doctor-wise revenue share, and the clinic's most-performed procedures.

9. Financial Assessment

Who can do this: Doctor, Administrator only.

- A per-case profitability table: enter each case's Lab Amount, Consultant Fee, Consumables, and Misc Expense, and Feast9 works out the Profit (Billed - all four expenses) next to the balance still pending.
- A loss on any case is highlighted in amber so it can't be missed.
- **Monthly Evaluation** rolls this up for a whole calendar month and adds clinic overhead (rent, salaries, electricity, EMI, cleaning, other) that isn't tied to a single case. A **Short Term / Long Term** switch additionally subtracts monthly depreciation on clinic equipment in Long Term view.
- **Capital Investments** is a simple asset register (equipment name, purchase date, cost, useful life) that feeds that depreciation figure. Assets are never edited once entered — a correction means deactivating the wrong entry and adding a fresh one, so past months' figures are never silently rewritten.

10. DPDP Data-Rights Requests

- Any staff member can log a request from a patient's page — the four types are **Access**, **Correction**, **Erasure**, and **Withdraw Consent**. Every request gets a 90-day resolution deadline automatically.
- A pending-requests count appears as a badge next to **DPDP Requests** in the navigation bar for every signed-in user.

Who can do this: Resolving a request — Doctor, Administrator only.

- **Access** — hand the patient a full export of their own data (a ready-made PDF is generated for this).
- **Correction** — make the actual correction through the normal patient-edit form, then mark the request Completed.
- **Erasure** — you must type the patient's name exactly as it's currently recorded to confirm. This anonymises their personal details permanently but keeps their clinical and financial history intact, exactly as the law requires.
- **Withdraw Consent** — turns off communications consent for that patient.

11. Settings & Administration

Who can do this: Administrator only, unless noted.

- **Users** — create staff accounts, assign a role, deactivate/reactivate an account (the very last active Administrator can never be deactivated), and force-reset a user's 2FA if they've lost their device.
- **Doctors and Case Types** — add the doctors and treatment types your clinic offers. Deactivating one just stops it being offered on new cases — it never deletes or breaks existing records that reference it.
- **Clinic Details** — name, address, phone, email — these appear on every generated PDF and in the navigation bar.
- **Clinic Logo & Login Screen** — upload a logo/login image and customise the heading and tagline shown on the sign-in page.
- **Import Data** — bulk-load historic patients from an Excel spreadsheet using the provided template. Every row still has to pass the same DPDP-notice and validation checks as manual registration, or it's skipped and reported — nothing invalid is ever partially imported. This always creates new patients; it never matches or updates existing ones.
- **Backups** — a nightly encrypted backup runs automatically; from here an Administrator can also trigger one on demand or download a past one. A warning banner appears on the Dashboard if a backup ever fails or goes stale.
- **Audit Log** — a complete, tamper-evident record of every sensitive action taken in the system, with who did it and when.
- **My Account** (every role) — change your own password, security question, 2FA, and Google account link.

12. Security Do's and Don'ts

Do

- Turn on Two-Factor Authentication.
- Log out (or lock the workstation) whenever you step away from a shared front-desk computer.
- Store your 2FA recovery codes somewhere safe and private, separate from the device itself.
- Report a lost or stolen device to an Administrator immediately, so your account can be secured.

Don't

- Share your username, password, or 2FA codes with anyone — including colleagues.
- Leave a patient record or the Reports/Financial pages open and unattended on a shared screen.
- Photograph or forward a 2FA QR code — it is the same as sharing your password.
- Try to work around a "403 / Access Denied" screen — it means your role genuinely doesn't include that action; ask an Administrator if you believe it's wrong.

13. Troubleshooting & FAQ

I can't see Reports/Analytics/Financial Assessment/Backups.

These are only available to Doctor and Administrator accounts. This is enforced deliberately and is not something a Receptionist account can be given access to individually — a role change would need to come from an Administrator.

A patient's follow-up reminder won't go away.

Either clear it directly from the case's Follow-up section, or book an appointment using the "Book Appointment" link on that section — booking clears the reminder automatically.

I'm stuck on a "Please confirm your password" screen.

That's the step-up re-authentication check for a sensitive action (see §2). Simply enter your password (and 2FA code, if enabled) again to continue.

I lost my phone and can't get my 2FA codes.

Use a recovery code if you saved one. Otherwise, ask an Administrator to reset your 2FA from the Users page — you'll set it up again from scratch.

Can I edit a visit note, prescription, or payment I entered by mistake?

No — these are permanent, append-only clinical and financial records by design. Add a new entry noting the correction instead. This keeps the record trustworthy.

Who do I contact for help?

Your clinic's Feast9 Administrator is your first point of contact for account and access issues.
